

Adj. Geospa. Obs. Homework 3

assigned 15 oct, due 22 oct

Adjust the observations for the given traverse by LS, indirect observations. Points 1, 2, 7, and 8 are fixed control points. Points 3, 4, 5, 6 are unknown. Control point coordinates and observations (with σ 's) are given in the following tables.

#	x	y
1	1240.0	5560.0
2	1330.0	5200.0
7	2365.0	5460.0
8	2720.0	5550.0

#	obs	σ
a_1	$47^\circ 43' 36.3''$	$10''$
d_1	342.536 m	$8\text{mm} + 3\text{ppm}$
a_2	$253^\circ 00' 26.9''$	$10''$
d_2	260.993 m	$8\text{mm} + 3\text{ppm}$
a_3	$99^\circ 51' 54.5''$	$10''$
d_3	268.329 m	$8\text{mm} + 3\text{ppm}$
a_4	$285^\circ 18' 01.1''$	$10''$
d_4	516.975 m	$8\text{mm} + 3\text{ppm}$
a_5	$78^\circ 16' 30.8''$	$10''$
d_5	179.227 m	$8\text{mm} + 3\text{ppm}$
a_6	$225^\circ 38' 01.0''$	$10''$

(a) for at least the first iteration, show your approximations, B, W, and f. Show evidence of convergence.

(b) show angle residuals in arc seconds.

(c) In general, the residuals for this problem will be smaller than you might expect by looking at the σ 's. Can you suggest why that is?
